

Multifunction Wall Scanner TH430

Multifunction wall scanner TH430 features five scanning modes:

- Stud $\frac{1}{2}$ in. scan: Locates the center and edges of wood and metal studs up to $\frac{1}{2}$ in. (13 mm) deep
- Stud 1 $\frac{1}{2}$ in. scan: Locates the center and edges of wood and metal studs up to 1 $\frac{1}{2}$ in. (38 mm) deep
- Metal Scan: Detects metal up to 2.36 in. (60 mm) deep
- AC Scan: Detects live unshielded AC wiring up to 2 in. (51 mm) deep

1. INSTALLING THE BATTERY

Push in the battery \square tab at the bottom of the tool and \square . Insert a new 9-volt battery, matching the positive (+) and negative (-) terminals to the battery wire.

Snap the battery into place and replace the door.

Low Battery Indicator:

The Low Battery indicator icon displays when the battery level is getting low. It is not sufficient to power the tool for proper operation. Please replace the 9-volt battery with a brand new battery immediately.

2. OPERATING TIPS

For optimum scanning results, it is important to properly hold the Multifunction Wall Scanner TH430 and move slowly when scanning. The following tips will provide more accurate scanning results:

- Grasp the handle with your thumb on one side and your fingers on the other side. Make sure your fingers are resting on the handle and not touching the surface being scanned or the scanning head of the tool.
- Hold the tool straight up and down, parallel to the studs, and do not rotate the tool.
- Keep tool flat against the wall and do not rock, tilt, or press hard when slowly sliding across the surface being scanned.

- Avoid placing your other hand, or any other part of your body, on the surface being scanned. This will interfere with the tool's performance.
- If you're receiving erratic scanning results, it may be a result of humidity, moisture within the wall cavity or drywall or recently applied paint or wallpaper that hasn't fully dried. While the moisture may not always be visible, it will interfere with the tool's sensitivity. Please allow a few days for the wall to dry out.
- Depending on the proximity of electrical wiring or pipes to the wall surface, the scanner may detect them in the same manner as studs. Caution should always be used when nailing, cutting, or drilling in walls, floors, and ceilings that may contain these items.
- To avoid surprises, remember that studs or joists are normally spaced 16 in. or 24 in. (41 or 61 cm) apart and are 1 $\frac{1}{2}$ in. (38 mm) in width. Anything closer together or a different width may not be a stud, joist, or framework. Always turn off power when working near electrical wires.

SCANNING DIFFERENT SURFACES

Wallpaper: Multifunction wall scanner TH430

functions normally on walls covered with wallpaper or fabric, unless the materials are metallic foil, contain metallic fibers, or are still wet after application. Wallpaper may need to dry for several weeks after application.

Freshly painted walls: MAY TAKE ONE WEEK OR LONGER TO DRY AFTER APPLICATION.

Lath & plaster: Due to irregularities in plaster thickness, it is difficult for Multifunction Wall Scanner TH430 to locate studs in Stud mode. Change to Metal Scan mode. \square To locate the nail heads holding \square to the studs, if the plaster has metal mesh reinforcement.

Multifunction Wall Scanner TH430 may be unable to detect through that material.

Extremely textured walls or acoustic ceiling: When scanning a ceiling or wall with an uneven surface, please clean board on the surface to be scanned and \square over the

ceiling board in Stud 1 $\frac{1}{2}$ in. scan mode. If irregular scanning results are received, switch to Metal Scan mode to locate nails or drywall screws that line up vertically where a stud or joist is positioned.

Wood framing, waterproofing, or gypsum drywall over plywood sheathing: Use Stud 1 $\frac{1}{2}$ in. scan mode and move the tool slowly. The Signal Strength indicator may only display limited

bars when the tool locates a stud through thick surfaces.

Multifunction wall scanner TH430 cannot scan for wood studs and posts through concrete or carpet and padding. In problematic situations, try using Metal Scan to locate nails or screws that may line up vertically where a stud or joist is positioned.

Note: Sensing depth and accuracy can vary due to moisture, contrast of materials, wall texture, and paint.

WARNING

Do not rely exclusively on the detector to locate items behind

the scanned surface. Use other information sources to help

locate items before penetrating the surface. Such additional

sources include construction plans, visible points of entry of pipes

and wiring into walls, such as in a basement, and in standard 16

and 24 in. (41 and 61 cm) stud spacing practices.

• Turn off power when working near electrical wires.

• Slowly slide tool across surface. A bottom point

arrow and EDGE indication will illuminate

indicating location of the stud edge.

3. SELECTING THE MODE

Press the mode switch button to the desired mode: Stud $\frac{1}{2}$ in. \square for

finding wood or small studs within $\frac{1}{2}$ in. Stud 1 $\frac{1}{2}$ in. \square for scanning

walls within 1 in. \square .

Stud 1 $\frac{1}{2}$ in. \square for scanning walls within 1 $\frac{1}{2}$ in.

thickness; Metal Scan for detecting metal, or AC Scan for locating live AC wiring.

The ON/OFF button should be pressed \square to power on the detector

before other operation.

4. TURNING ON/CALIBRATING THE TOOL

Multifunction wall scanner TH430 can be calibrated anywhere on the wall.

• Press the Multifunction Wall Scanner TH430 against the wall below the \square pressing the ON/OFF button.

• Press the power button, the LCD always displays in Stud $\frac{1}{2}$ in. \square .

• Press the Scan button to start calibration. The decreasing bars will disappear and buzzes will beep one time and the calibration is completed.

(keep the tool flat against the wall and begin scanning.)

Note: It is important to wait for calibration to complete (2–3 seconds) every time before moving the scanner.

12. Battery (Back of unit)
13. Stud Detection Indication
14. Low Battery Indication

5. FINDING A STUD

Always on Stud $\frac{1}{2}$ in. scan with the scanner placed flat against

the wall. Press the mode switch button to the mode selected, place

the tool flat against the wall, then press the \square button.

Wait for the red/green bars to stabilize and then to count.

calibration has completed before moving scanner.

Slowly slide tool across surface. A bottom point

arrow and EDGE indication will illuminate

indicating location of the stud edge.

Continue sliding tool. When the center of a stud

is located, the full bars on the Signal Strength

indicator, the pointed arrow on the top of the bars,

on the screen, if you still cannot locate a stud, try

Stud 1 in. Or Stud 1 $\frac{1}{2}$ in. Scan mode.

Continuous

sliding tool. When the

center of a deeper stud (thicker wall), when the

studs are located, the full bars will show

on the screen. If you still cannot locate a stud, try

Stud 1 in. Or Stud 1 $\frac{1}{2}$ in. Scan mode.

Continuous

sliding tool. When the

center of a deeper stud (thicker wall), when the

studs are located, the full bars will show

on the screen. If you still cannot locate a stud, try

Stud 1 in. Or Stud 1 $\frac{1}{2}$ in. Scan mode.

Continuous

sliding tool. When the

center of a deeper stud (thicker wall), when the

studs are located, the full bars will show

on the screen. If you still cannot locate a stud, try

sliding tool. When the

center of a deeper stud (thicker wall), when the

WARNING

DO NOT ASSUME THERE ARE NO LIVE ELECTRICAL WIRES IN THE WALL. DO NOT TAKE ACTIONS THAT COULD BE DANGEROUS.

ELECTRICAL POWER, GAS, AND WATER SUPPLIES BEFORE PENETRATING A SURFACE. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN ELECTRIC SHOCK, FIRE, AND/OR SERIOUS INJURY OR PROPERTY DAMAGE.

Always turn off power when working near electrical wires.

7. SCANNING IN METAL MODE

After Wall Scanning the areas less than 12 in. apart from the center and/or thicker walls, to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Step 112 in. Scan on thicker walls to quickly locate the center and edges. Use Metal Scan to determine if the previous reading is still scan.

Figure A

Note: # any bare display on the screen, indicate a metal. Small targets or targets deep within the surface may only illuminate some of the bar and not the center line or both. In this case, use the highest indication to determine the metal position.

8. SCANNING IN AC MODE

As with Metal Scan Mode, AC Scan mode has inductive calibration and works in the same manner.

1. (Figure A) Press mode switch button to AC Scan mode. Press the tool face against the wall, then press the Scan button. Wait for the beep to determine calibration has completed before moving the tool. Once calibration has completed, slowly the scanner across the surface. Mark the location where you get the highest AC indication (the more Metal seen on the screen). If it is a strong target, the top indicated area will glow, and a steady beep will sound. Continue in same direction until display bars recede. Reverse direction and mark the next where the display bars form the return. That midpoint of the two marks is the location of the center of the live AC wiring. If the unit indicates live electricity over a large area, you can reduce the sensitivity of the tool to refine the scanning area and more accurately locate the live AC wiring by following steps 2 and 3 below.

2. (Figure B) To further pinpoint the location of the live AC wiring, scan the area again. Release the Scan button and then turn the unit back on, this time starting on the wall over one of the previous marks. Then will re-set the tool to a lower sensitivity and narrow the scan area.

3. (Figure C) Scan in both directions as in Step 2. The area indicated should become smaller so you can more precisely identify the location of the AC wires. This procedure can be repeated to narrow the field even further.

Note: AC Scan will only detect live (hot) unshielded AC wiring. Please refer to the WARNING statement in number 6, AC WARNING Detection, for more important details and warnings about AC detection.

Figure B

Figure C

Figure D

Note: # any bare display on the screen, indicate a metal. Small targets or targets deep within the surface may only illuminate some of the bar and not the center line or both. In this case, use the highest indication to determine the metal position.

9. HELPFUL HINTS (See also number 2, Operating Tips)

Detects other objects besides metal.

In Metal Scan mode.

First metal target in there should be.

Most likely not a stud if not near a door or window.

* Electrical wiring and #/steel/plastic spurs may be near or touching back surface of wall.

* Scan the area in Metal Scan and AC Scan to determine if metal or hot AC is present.

* All metal placed directly above or below the scan area.

* A stud nailing would measure approximately 1.5 in. (38 mm) apart from each edge, varying larger or smaller is

likely depending on wall.

* Tool calibrated over metal object.

* Metal targets 10 in. deep or steel.

* The scanner may have been calibrated with a metal object (nothing conductive). Try calibrating in another location.

* Scan to both horizontal end vertical locations. Metal sensitivity is increased when metal object is parallel to sensor.

* To reduce sensitivity, re-calibrate the tool over either of first two metals (Metal only).

* Scan the outer edges so you know where to look.

* Constant reading of same item when not looking.

* You might see metal when not in use.

* Constant reading of same item when not looking.

* Wires are shielded by metal conduit. Beware!

* Try Metal Scan mode to see if you can find metal, wires or metal .

* If a switch controls an outlet, make sure it is ON for detection. Turn off when working near electrical wires.

* Wires longer than 2 ft (15 mm) from surface.

* Wires may not be live.

* Battery level low for proper operation.

* Replace with new 9 V battery.

* Scan the deeper when trying to calibrate and scan again.

Detects other objects besides metal.

In AC Scan mode.

First metal target in there should be.

Most likely not a stud if not near a door or window.
